Review of modular arithmetic $(\mathbb{Z}/n\mathbb{Z})$

Definition (Modular arithmetic notation)

Let $n \ge 0$. If a, b have same remainder when divided by n, we say that: $a \equiv b \mod n$

Review of modular arithmetic $(\mathbb{Z}/n\mathbb{Z})$

Definition (Modular arithmetic notation)

Let $n \ge 0$. If a, b have same remainder when divided by n, we say that: $a \equiv b \mod n$

Review of modular arithmetic $(\mathbb{Z}/n\mathbb{Z})$

Definition (Modular arithmetic notation)

Let $n \ge 0$. If a, b have same remainder when divided by n, we say that: $a \equiv b \mod n$

Review of modular arithmetic $(\mathbb{Z}/n\mathbb{Z})$

Definition (Modular arithmetic notation)

Let $n \ge 0$. If a, b have same remainder when divided by n, we say that: $a \equiv b \mod n$

Every number is equivalent $\mod n$ to one lying between 0 and n-1:

```
10 \equiv ? \mod 7
```

Review of modular arithmetic $(\mathbb{Z}/n\mathbb{Z})$

Definition (Modular arithmetic notation)

Let $n \ge 0$. If a, b have same remainder when divided by n, we say that: $a \equiv b \mod n$

Every number is equivalent $\mod n$ to one lying between 0 and n-1:

Example

$$10 \equiv 3 \mod 7$$

Review of modular arithmetic $(\mathbb{Z}/n\mathbb{Z})$

Definition (Modular arithmetic notation)

Let $n \ge 0$. If a, b have same remainder when divided by n, we say that: $a \equiv b \mod n$

Every number is equivalent $\mod n$ to one lying between 0 and n-1:

Example

$$10 \equiv 3 \mod 7$$

Review of modular arithmetic $(\mathbb{Z}/n\mathbb{Z})$

Definition (Modular arithmetic notation)

Let $n \ge 0$. If a, b have same remainder when divided by n, we say that: $a \equiv b \mod n$

Every number is equivalent $\mod n$ to one lying between 0 and n-1:

Example

$$10 \equiv 3 \mod 7$$

Review of modular arithmetic $(\mathbb{Z}/n\mathbb{Z})$

Definition (Modular arithmetic notation)

Let $n \ge 0$. If a, b have same remainder when divided by n, we say that: $a \equiv b \mod n$

Every number is equivalent $\mod n$ to one lying between 0 and n-1:

Example

$$10 \equiv 3 \mod 7$$

Review of modular arithmetic $(\mathbb{Z}/n\mathbb{Z})$

Definition (Modular arithmetic notation)

Let $n \ge 0$. If a, b have same remainder when divided by n, we say that: $a \equiv b \mod n$

Every number is equivalent $\mod n$ to one lying between 0 and n-1:

Example

$$10 \equiv 3 \mod 7$$

$$15 \equiv ? \mod 5$$

Review of modular arithmetic $(\mathbb{Z}/n\mathbb{Z})$

Definition (Modular arithmetic notation)

Let $n \ge 0$. If a, b have same remainder when divided by n, we say that: $a \equiv b \mod n$

Every number is equivalent $\mod n$ to one lying between 0 and n-1:

Example

$$10 \equiv 3 \mod 7$$

$$15 \equiv 0 \mod 5$$

$$15 = 3 \cdot 5 + 0$$
 has remainder 0 when div. by 5.

Review of modular arithmetic $(\mathbb{Z}/n\mathbb{Z})$

Definition (Modular arithmetic notation)

Let $n \ge 0$. If a, b have same remainder when divided by n, we say that: $a \equiv b \mod n$

Every number is equivalent $\mod n$ to one lying between 0 and n-1:

Example

```
10 \equiv 3 \mod 7
15 \equiv 0 \mod 5
```

 $10 = 7 \cdot 1 + 3$ has remainder 3 when div. by 7.

 $15 = 3 \cdot 5 + 0$ has remainder 0 when div. by 5.

Review of modular arithmetic $(\mathbb{Z}/n\mathbb{Z})$

Definition (Modular arithmetic notation)

Let $n \ge 0$. If a, b have same remainder when divided by n, we say that: $a \equiv b \mod n$

Every number is equivalent $\mod n$ to one lying between 0 and n-1:

Example

```
10 \equiv 3 \mod 7
```

 $15 \equiv 0 \mod 5$

$$10 = 7 \cdot 1 + 3$$
 has remainder 3 when div. by 7.

$$15 = 3 \cdot 5 + 0$$
 has remainder 0 when div. by 5.

Definition (Modular arithmetic notation)

Let $n \ge 0$. If a, b have same remainder when divided by n, we say that: $a \equiv b \mod n$

Every number is equivalent $\mod n$ to one lying between 0 and n-1:

Example

Finding the number between 0 and n-1 as described above is called "reducing a number modulo n".

Groups 4/13

Lemma

Let $a_1 \equiv a_2 \mod n$ and $b_1 \equiv b_2 \mod n$.

- $a_1 \pm b_1 \equiv a_2 \pm b_2 \mod n$ (Mod. arithm. respects addition).
- $a_1 \cdot b_1 \equiv a_2 \cdot b_2 \mod n$ (Mod. arithm. respects multiplication).

Proof. [Mult. respected].

Since
$$a_1 \equiv a_2 \mod n \Rightarrow a_1 = n \cdot p + a_2$$
 for some p .
Since $b_1 \equiv b_2 \mod n \Rightarrow b_1 = n \cdot q + b_2$ for some q .

$$a_1 \cdot b_1 = (n \cdot p + a_2) \cdot (n \cdot q + b_2)$$

= $n^2(p+q) + n(b_2 + a_2) + b_2 + a_2$
 $\equiv b_2 + a_2 \mod n$

Groups 4/13

Lemma

Let $a_1 \equiv a_2 \mod n$ and $b_1 \equiv b_2 \mod n$.

- $a_1 \pm b_1 \equiv a_2 \pm b_2 \mod n$ (Mod. arithm. respects addition).
- $a_1 \cdot b_1 \equiv a_2 \cdot b_2 \mod n$ (Mod. arithm. respects multiplication).

Proof. [Mult. respected].

Since
$$a_1 \equiv a_2 \mod n \Rightarrow a_1 = n \cdot p + a_2$$
 for some p .
Since $b_1 \equiv b_2 \mod n \Rightarrow b_1 = n \cdot q + b_2$ for some q .
 $a_1 \cdot b_1 = (n \cdot p + a_2) \cdot (n \cdot q + b_2)$
 $= n^2(p+q) + n(b_2 + a_2) + b_2 + a_2$
 $\equiv b_2 + a_2 \mod n$

Example

Reduce $2030 \cdot 201800003 \mod 2018$. $2030 = 2018 + 12 \equiv 12 \mod 2018$ $201800003 = 20180000 + 3 = 2018 \cdot 10^4 + 3 \equiv 3 \mod 2018$ $2030 \cdot 201800003 \equiv 12 \cdot 3 = 36 \mod 2018$

Groups 5/13

Definition (Group, mathematics)

A group \mathcal{G} is a set equipped with operation \cdot with $a \cdot b \in \mathcal{G}$ so that:

- (a · b) · c = a · (b · c) for every a, b, c ∈ G. (Associativity)
 There exists e ∈ G with e · a = a · e = a for every a ∈ G. (Identity)
- $= \text{For every a evista } h \in \mathcal{C} \text{ at a } h = 0 \text{ Write } h = 0 \text{ (Inverse)}$
- For every a exists $b \in \mathcal{G}$ s.t. $a \cdot b = e$. Write $b = a^{-1}$. (Inverse)

Definition (Abelian (commutative) group)

The group is called abelian (commutative) if in addition:

• $a \cdot b = b \cdot a$ for all $a, b \in \mathcal{G}$.

Groups 6/13

- $\bullet (a \cdot b) \cdot c = a \cdot (b \cdot c).$
- Exists e s.t. $e \cdot a = a \cdot e = a$.
- Given a exists b s.t. $a \cdot b = e$.
- $a \cdot b = b \cdot a$.

Example

Take $G = \mathbb{Z}$, define $a \cdot b = a + b$.

- (a+b)+c=a+(b+c).
- Set e = 0. Then 0 + a = a + 0 = a.
- For every a, take b = -a. Then a + b = a + (-a) = 0 = e.
- \bullet a+b=b+a for all a,b.

Groups 7/13

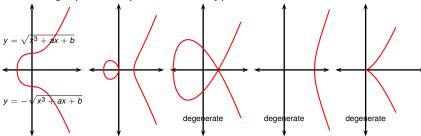

Definition

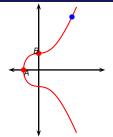

The set of points $\{(x, y)\}$ for which

$$y^2 = x^3 + ax + b$$

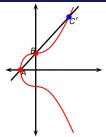

is called an elliptic curve (possibly degenerate).

- Precise definition of all curves that are "elliptic": outside our scope.
- Precise definition of "degenerate": outside our scope.
- We do not fix the number types of x, y: possibly $\mathbb{Q}, \mathbb{R}, \mathbb{C}, \mathbb{Z}_p, \dots$
- Over ℝ, graph of elliptic has five types:

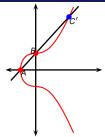

Let
$$A = (x_A, y_A)$$
, $B = (x_B, y_B)$ - points on non-degenerate elliptic curve: $y^2 = x^3 + ax + b$.

Definition (Elliptic curve group law)

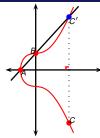

Let
$$A = (x_A, y_A)$$
, $B = (x_B, y_B)$ - points on non-degenerate elliptic curve: $y^2 = x^3 + ax + b$.

• Let C' be intersection of line through A, B with the elliptic curve.

Let
$$A = (x_A, y_A)$$
, $B = (x_B, y_B)$ - points on non-degenerate elliptic curve: $y^2 = x^3 + ax + b$.

- Let C' be intersection of line through A, B with the elliptic curve.
- Unless the line through A, B is vertical, such C' exists.

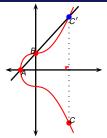

Definition (Elliptic curve group law)

• If line through A, B non-vertical, define $A \cdot B = C$.

Let
$$A = (x_A, y_A)$$
, $B = (x_B, y_B)$ - points on non-degenerate elliptic curve: $y^2 = x^3 + ax + b$.

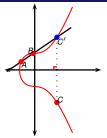

- Let C' be intersection of line through A, B with the elliptic curve.
- Unless the line through A, B is vertical, such C' exists.
- Let C be the reflection of C' across the x axis.

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly

Let
$$A = (x_A, y_A)$$
, $B = (x_B, y_B)$ - points on non-degenerate elliptic curve: $y^2 = x^3 + ax + b$.

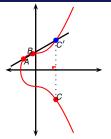

- Let C' be intersection of line through A, B with the elliptic curve.
- Unless the line through A, B is vertical, such C' exists.
- Let C be the reflection of C' across the x axis.

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly

Let
$$A = (x_A, y_A)$$
, $B = (x_B, y_B)$ - points on non-degenerate elliptic curve: $y^2 = x^3 + ax + b$.

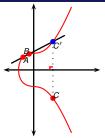

- Let C' be intersection of line through A, B with the elliptic curve.
- Unless the line through A, B is vertical, such C' exists.
- Let C be the reflection of C' across the x axis.

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly

Let
$$A = (x_A, y_A)$$
, $B = (x_B, y_B)$ - points on non-degenerate elliptic curve: $y^2 = x^3 + ax + b$.

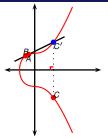

- Let C' be intersection of line through A, B with the elliptic curve.
- Unless the line through A, B is vertical, such C' exists.
- Let C be the reflection of C' across the x axis.

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly

Let
$$A = (x_A, y_A)$$
, $B = (x_B, y_B)$ - points on non-degenerate elliptic curve: $y^2 = x^3 + ax + b$.

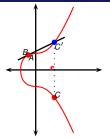

- Let C' be intersection of line through A, B with the elliptic curve.
- Unless the line through A, B is vertical, such C' exists.
- Let C be the reflection of C' across the x axis.

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly

Let
$$A = (x_A, y_A)$$

- Let C' be intersection of line through A, B with the elliptic curve.
- Unless the line through A, B is vertical, such C' exists.
- Let C be the reflection of C' across the x axis.

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly but use the tangent through A in place of the line through A, B.

Let
$$A = (x_A, y_A)$$
, $B = (x_B, y_B)$ - points on non-degenerate elliptic curve: $y^2 = x^3 + ax + b$.

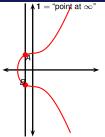

- Let C' be intersection of line through A, B with the elliptic curve.
- Unless the line through A, B is vertical, such C' exists.
- Let C be the reflection of C' across the x axis.

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical

Let
$$A = (x_A, y_A)$$
, $B = (x_B, y_B)$ - points on non-degenerate elliptic curve: $y^2 = x^3 + ax + b$.

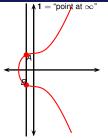

- Let C' be intersection of line through A, B with the elliptic curve.
- Unless the line through A, B is vertical, such C' exists.
- Let C be the reflection of C' across the x axis.

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.

Let
$$A = (x_A, y_A)$$
, $B = (x_B, y_B)$ - points on non-degenerate elliptic curve: $y^2 = x^3 + ax + b$.

- Let C' be intersection of line through A, B with the elliptic curve.
- Unless the line through *A*, *B* is vertical, such *C'* exists.
- Let C be the reflection of C' across the x axis.

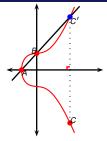

Definition (Elliptic curve group law)

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.

Let $A = (x_A, y_A)$, $B = (x_B, y_B)$ - points on non-degenerate elliptic curve: $y^2 = x^3 + ax + b$.

- Let C' be intersection of line through A, B with the elliptic curve.
- Unless the line through A, B is vertical, such C' exists.
- Let C be the reflection of C' across the x axis.

Definition (Elliptic curve group law)

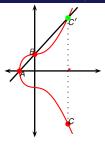

• If line through A, B non-vertical, define $A \cdot B = C$.

- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.

Let $A = (x_A, y_A)$, $B = (x_B, y_B)$ - points on non-degenerate elliptic curve: $y^2 = x^3 + ax + b$.

- Let C' be intersection of line through A, B with the elliptic curve.
- Unless the line through A, B is vertical, such C' exists.
- Let C be the reflection of C' across the x axis.

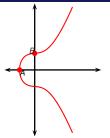

WARNING. Many authors use + in place of \cdot and $\mathbf{0}$ in place of $\mathbf{1}$.

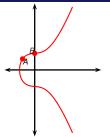

Definition (Elliptic curve group law)

• If line through A, B non-vertical, define $A \cdot B = C$.

- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.
- turns the points on the curve into a group.

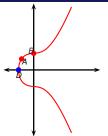

Definition (Elliptic curve group law)

• If line through A, B non-vertical, define $A \cdot B = C$.

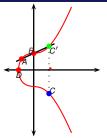

- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.
- turns the points on the curve into a group.
- In particular: why does the associative law hold:

$$\underbrace{\left(\underbrace{A \cdot B}_{=C}\right) \cdot D \stackrel{?}{=} A \cdot \left(\underbrace{B \cdot D}_{=F}\right)}_{=F}$$

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.
- turns the points on the curve into a group.
- In particular: why does the associative law hold:

$$\underbrace{\left(\underbrace{A \cdot B}_{=C}\right) \cdot D}_{=F} \stackrel{?}{=} A \cdot \left(\underbrace{B \cdot D}_{=F}\right)$$

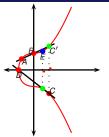

Definition (Elliptic curve group law)

• If line through A, B non-vertical, define $A \cdot B = C$.

- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.
- turns the points on the curve into a group.
- In particular: why does the associative law hold:

$$\underbrace{\begin{pmatrix} A \cdot B \\ = C \end{pmatrix}} \cdot D \stackrel{?}{=} A \cdot \underbrace{\begin{pmatrix} B \cdot D \\ = F \end{pmatrix}}_{=F}$$

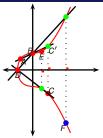

Definition (Elliptic curve group law)

• If line through A, B non-vertical, define $A \cdot B = C$.

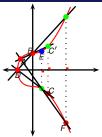

- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.
- turns the points on the curve into a group.
- In particular: why does the associative law hold:

$$\underbrace{\begin{pmatrix} A \cdot B \\ = C \end{pmatrix}} \cdot D \stackrel{?}{=} A \cdot \underbrace{\begin{pmatrix} B \cdot D \\ = F \end{pmatrix}}_{=F}$$

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.
- turns the points on the curve into a group.
- In particular: why does the associative law hold:

$$\underbrace{\begin{pmatrix} A \cdot B \\ = C \end{pmatrix}} \cdot D \stackrel{?}{=} A \cdot \underbrace{\begin{pmatrix} B \cdot D \\ = F \end{pmatrix}}_{=F}$$

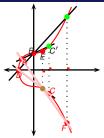

Definition (Elliptic curve group law)

• If line through A, B non-vertical, define $A \cdot B = C$.

- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.
- turns the points on the curve into a group.
- In particular: why does the associative law hold:

$$\underbrace{\begin{pmatrix} A \cdot B \\ = C \end{pmatrix}}_{=E} \cdot D \stackrel{?}{=} A \cdot \underbrace{\begin{pmatrix} B \cdot D \\ = F \end{pmatrix}}_{=E}$$

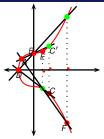

Definition (Elliptic curve group law)

• If line through A, B non-vertical, define $A \cdot B = C$.

- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.
- turns the points on the curve into a group.
- In particular: why does the associative law hold:

$$\underbrace{\begin{pmatrix} A \cdot B \\ = C \end{pmatrix}} \cdot D \stackrel{?}{=} A \cdot \underbrace{\begin{pmatrix} B \cdot D \\ = F \end{pmatrix}}_{=F}$$

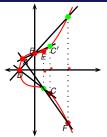

• I.e., why does AF intersect DC on a point on the curve?

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.
- turns the points on the curve into a group.
- In particular: why does the associative law hold:

$$\underbrace{\begin{pmatrix} A \cdot B \\ = C \end{pmatrix}} \cdot D \stackrel{?}{=} A \cdot \underbrace{\begin{pmatrix} B \cdot D \\ = F \end{pmatrix}}_{=F}$$

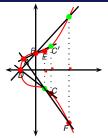

- I.e., why does AF intersect DC on a point on the curve?
- When we derive formulas for this construction, we can algebraically prove the above.

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.
- turns the points on the curve into a group.
- In particular: why does the associative law hold:

$$\underbrace{\begin{pmatrix} A \cdot B \\ = C \end{pmatrix}}_{=E} \cdot D \stackrel{?}{=} A \cdot \underbrace{\begin{pmatrix} B \cdot D \\ = F \end{pmatrix}}_{=E}$$

- I.e., why does AF intersect DC on a point on the curve?
- When we derive formulas for this construction, we can algebraically prove the above.
- However our proof will appear an algebraic coincidence/miracle.

- If line through A, B non-vertical, define $A \cdot B = C$.
- Define A · A similarly but use the tangent through A in place of the line through A, B.
- If line through A, B vertical, define $A \cdot B = 1$.
- Define $\mathbf{1} \cdot A = A \cdot \mathbf{1} = A$ for all A.
- turns the points on the curve into a group.
- In particular: why does the associative law hold:

$$\underbrace{\begin{pmatrix} A \cdot B \\ = C \end{pmatrix}}_{=E} \cdot D \stackrel{?}{=} A \cdot \underbrace{\begin{pmatrix} B \cdot D \\ = F \end{pmatrix}}_{=E}$$

- I.e., why does AF intersect DC on a point on the curve?
- When we derive formulas for this construction, we can algebraically prove the above.
- However our proof will appear an algebraic coincidence/miracle.
- An answer to why this all works is beyond current scope.

Groups 10/13

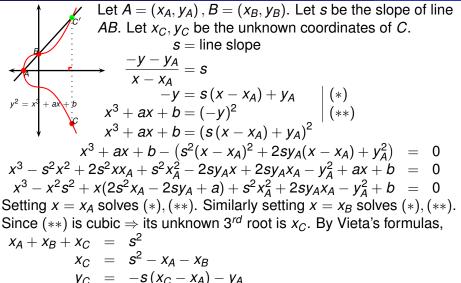

Niels Henrik Abel (1802-1829), pioneer of modern algebra and elliptic functions. Abelian groups are named after him.

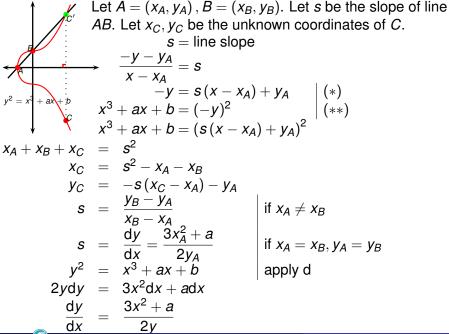

Deierstraf

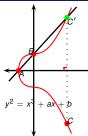

Karl Weierstrass (1815-1897), pioneer of elliptic functions. The definition of elliptic curve given in our text is sometimes called "Weierstrass normal form". Groups 11/13

Groups 11/13

Groups

Let
$$A = (x_A, y_A)$$
, $B = (x_B, y_B)$. Let s be the slope of line AB . Let x_C, y_C be the unknown coordinates of C . $s = \text{line slope}$

$$x_{C} = s^{2} - x_{A} - x_{B}$$
 $y_{C} = -s(x_{C} - x_{A}) - y_{A}$
 $s = \frac{y_{B} - y_{A}}{x_{B} - x_{A}}$ if $x_{A} \neq x_{B}$
 $s = \frac{3x_{A}^{2} + a}{2y_{A}}$ if $x_{A} = x_{B}, y_{A} = y_{B}$

if
$$x_A \neq x_B$$

if $x_A = x_B, y_A = y_B$

(Elliptic curve group law, algebraic definition)

Let (x_A, y_A) , (x_B, y_B) be two points on the elliptic curve.

$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } x_A = x_B, y_A = y_B \end{cases}$$

$$x_C = s^2 - x_A - x_B \qquad \text{if } y_A \neq -y_B$$

$$y_C = -s(x_C - x_A) - y_A \qquad \text{if } y_A \neq -y_B$$

- If $y_A = -y_B$, define $(x_C, y_C) = 1$.
- Define $\mathbf{1} \cdot (x_A, y_A) = (x_A, y_A)$.
- *Define* **1** · **1** = **1**.

(Elliptic curve group law, algebraic definition)

Let (x_A, y_A) , (x_B, y_B) be two points on the elliptic curve.

$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } x_A = x_B, y_A = y_B \end{cases}$$

$$x_C = s^2 - x_A - x_B \qquad \text{if } y_A \neq -y_B$$

$$y_C = -s(x_C - x_A) - y_A \qquad \text{if } y_A \neq -y_B$$

- If $y_A = -y_B$, define $(x_C, y_C) = 1$.
- Define $\mathbf{1} \cdot (x_A, y_A) = (x_A, y_A)$.
- Define 1 · 1 = 1.
- Above we assumed working over \mathbb{C} or \mathbb{R} .

(Elliptic curve group law, algebraic definition)

Let (x_A, y_A) , (x_B, y_B) be two points on the elliptic curve.

$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } x_A = x_B, y_A = y_B \end{cases}$$

- However, formulas are well-defined over arbitrary field.
- A field is a set where the operations +, -, *, / are defined and follow the basic arithmetic rules.
- Full definition of field: outside of present scope.

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Let $y^2 = x^3 - x + 1$. Show g = (3,5) is a point on the curve. Compute $g^2 = g \cdot g$ and $g^3 = g \cdot g \cdot g$.

• That the point is on the curve can be seen from:

$$5^2 \stackrel{?}{=} 3^3 - 3 + 1 =$$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Let $y^2 = x^3 - x + 1$. Show g = (3,5) is a point on the curve. Compute $g^2 = g \cdot g$ and $g^3 = g \cdot g \cdot g$.

• That the point is on the curve can be seen from:

$$25 = 5^2 \stackrel{?}{=} 3^3 - 3 + 1 = 25$$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^2 = (3,5) \cdot (3,5) =$$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^2 = (3,5) \cdot (3,5) =$$

$$s_2 = ?$$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^2 = (3,5) \cdot (3,5) =$$

 $s_2 = \frac{3 \cdot 3^2 - 1}{2 \cdot 5} = \frac{13}{5}$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^2 = (3,5) \cdot (3,5) =$$
 $s_2 = \frac{3 \cdot 3^2 - 1}{2 \cdot 5} = \frac{13}{5}$
 $x_2 = ?$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^{2} = (3,5) \cdot (3,5) =$$

$$s_{2} = \frac{3 \cdot 3^{2} - 1}{2 \cdot 5} = \frac{13}{5}$$

$$x_{2} = \left(\frac{13}{5}\right)^{2} - 3 - 3 = \frac{19}{25}$$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^2 = (3,5) \cdot (3,5) = ?$$
 $s_2 = \frac{3 \cdot 3^2 - 1}{2 \cdot 5} = \frac{13}{5}$
 $x_2 = \left(\frac{13}{5}\right)^2 - 3 - 3 = \frac{19}{25}$
 $y_2 = ?$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^{2} = (3,5) \cdot (3,5) = \left(\frac{19}{25}, \frac{103}{125}\right)$$

$$s_{2} = \frac{3 \cdot 3^{2} - 1}{2 \cdot 5} = \frac{13}{5}$$

$$x_{2} = \left(\frac{13}{5}\right)^{2} - 3 - 3 = \frac{19}{25}$$

$$y_{2} = -\frac{13}{5}(x_{2} - 3) - 5 = \frac{103}{125}$$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

$$g^3 = g^2 \cdot g$$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

$$g^3 = g^2 \cdot g = \left(\frac{19}{25}, \frac{103}{125}\right) \cdot (3,5) =$$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^3 = g^2 \cdot g = \left(\frac{19}{25}, \frac{103}{125}\right) \cdot (3,5) =$$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^3 = g^2 \cdot g = \left(\frac{19}{25}, \frac{103}{125}\right) \cdot (3, 5) =$$
 $s_3 = \frac{\frac{103}{125} - 5}{\frac{19}{25} - 3} = \frac{261}{140}$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^{3} = g^{2} \cdot g = \left(\frac{19}{25}, \frac{103}{125}\right) \cdot (3,5) =$$

$$s_{3} = \frac{\frac{103}{125} - 5}{\frac{19}{25} - 3} = \frac{261}{140}$$

$$x_{3} = ? = -\frac{223}{784}$$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^{3} = g^{2} \cdot g = \left(\frac{19}{25}, \frac{103}{125}\right) \cdot (3,5) =$$

$$s_{3} = \frac{\frac{103}{125} - 5}{\frac{19}{25} - 3} = \frac{261}{140}$$

$$x_{3} = s_{3}^{2} - \frac{19}{25} - 3 = -\frac{223}{784}$$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^{3} = g^{2} \cdot g = \left(\frac{19}{25}, \frac{103}{125}\right) \cdot (3, 5) =$$

$$s_{3} = \frac{\frac{103}{125} - 5}{\frac{19}{25} - 3} = \frac{261}{140}$$

$$x_{3} = s_{3}^{2} - \frac{19}{25} - 3 = -\frac{223}{784}$$

$$y_{3} = ?$$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^{3} = g^{2} \cdot g = \left(\frac{19}{25}, \frac{103}{125}\right) \cdot (3,5) = ?$$

$$s_{3} = \frac{\frac{103}{125} - 5}{\frac{19}{25} - 3} = \frac{261}{140}$$

$$x_{3} = s_{3}^{2} - \frac{19}{25} - 3 = -\frac{223}{784}$$

$$y_{3} = -\left(\frac{261}{140}\right) \left(-\frac{223}{784} - \frac{19}{25}\right) - \frac{103}{125}$$

$$= -\left(\frac{261}{140}\right) \left(-\frac{223}{784} - 3\right) - 5$$

$$= \frac{24655}{21952}$$

Product:
$$s = \begin{cases} \frac{y_B - y_A}{x_B - x_A} & \text{if } x_A \neq x_B \\ \frac{3x_A^2 + a}{2y_A} & \text{if } A = B \end{cases}$$
, $y_C = -s(x_C - x_A) - y_A$

Example

$$g^{3} = g^{2} \cdot g = \left(\frac{19}{25}, \frac{103}{125}\right) \cdot (3,5) = \left(-\frac{223}{784}, \frac{24655}{21952}\right)$$

$$s_{3} = \frac{\frac{103}{125} - 5}{\frac{19}{25} - 3} = \frac{261}{140}$$

$$x_{3} = s_{3}^{2} - \frac{19}{25} - 3 = -\frac{223}{784}$$

$$y_{3} = -\left(\frac{261}{140}\right)\left(-\frac{223}{784} - \frac{19}{25}\right) - \frac{103}{125}$$

$$= -\left(\frac{261}{140}\right)\left(-\frac{223}{784} - 3\right) - 5$$

$$= \frac{24655}{21952}$$
